

C# Development Trends for Future

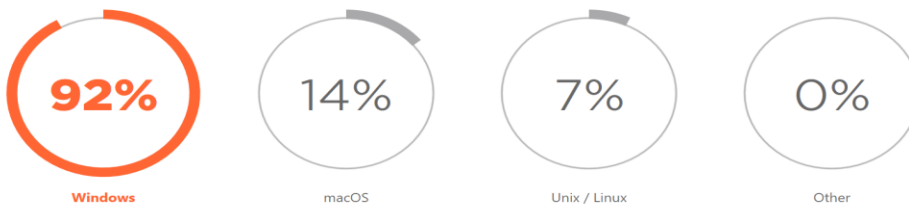

C# developers largely keep up to date, with roughly half of all C# developers working in version 8. While many still support legacy C# codebases, the results show that all previous versions of C# have fewer developers this year than they did last year. **C# 7 is down to 48% from 63%, and C# 6 is down to 27% from 39%**, both showing significant drops in usage.

What versions of C# do you regularly use?

The most popular C# runtime is .NET Framework! While C# developers keep their language skills up to date, many haven't migrated to .NET Core, yet. However, .NET Core is gaining popularity as 57% of C# developers use it regularly. **We suspect that .NET Core will become more popular next year than .NET.**

What operating system is your C# development environment using?
