TEKLRN

TENSORFLOW LEVEL 14

1. Save and load a model using a distribution strategy
   - Overview

2. Save and load the model

3. The Keras APIs

4. Restore the model without tf.distribute.Strategy:

5. The tf.saved_model APIs

6. Which API should I use?
   - Caveats

7. Distributed Input

8. Distributed Datasets

9. tf.distribute.Strategy.experimental_distribute_dataset
   - Usage
   - Properties
   - Batching
   - Sharding
   - Prefetching

10. tf.distribute.Strategy.experimental_distribute_datasets_from_function
    - Usage
    - Properties
    - Batching
    - Sharding
    - Prefetching

11. Distributed Iterators
    - Usages
    - Use a Pythonic for loop construct
    - Use iter to create an explicit iterator
    - Using element_spec property

12. Partial Batches
    - Caveats
    - How do I distribute my data if I am not using a canonical tf.data.Dataset instance?
    - Use experimental_distribute_values_from_function for arbitrary tensor inputs
    - Use tf.data.Dataset.from_generator if your input is from a generator
